Active Living Promotion: What Is Associated With Successful Collaboration In Public Health Networks

Description/abstract: Public health organizations increasingly find themselves less as stand-alone organizations, but facilitators, mediators and negotiators with many diverse collaborating partners in order to achieve successful outcomes. Determining which factors, at both the organization level, as well as the network level, are predictors of perceived success can be helpful in forming, maintaining and improving those collaborations. Using the PARTNER survey tool (www.partnertool.net), the authors surveyed 53 networks focused on active living promotion. They analyzed the data in order to determine which characteristics of networks and participating organizations were associated with perceived success of their collaborative mission.
